Table of Descriptive Statistics for Mean SWB and Income per capita

Summary statistics					
	Mean	SD	p25	Median	p75
meanswb	5.326	.858	4.962	5.378	5.747
gdppc	5139.753	3576.645	2471.646	3658.932	7937.483

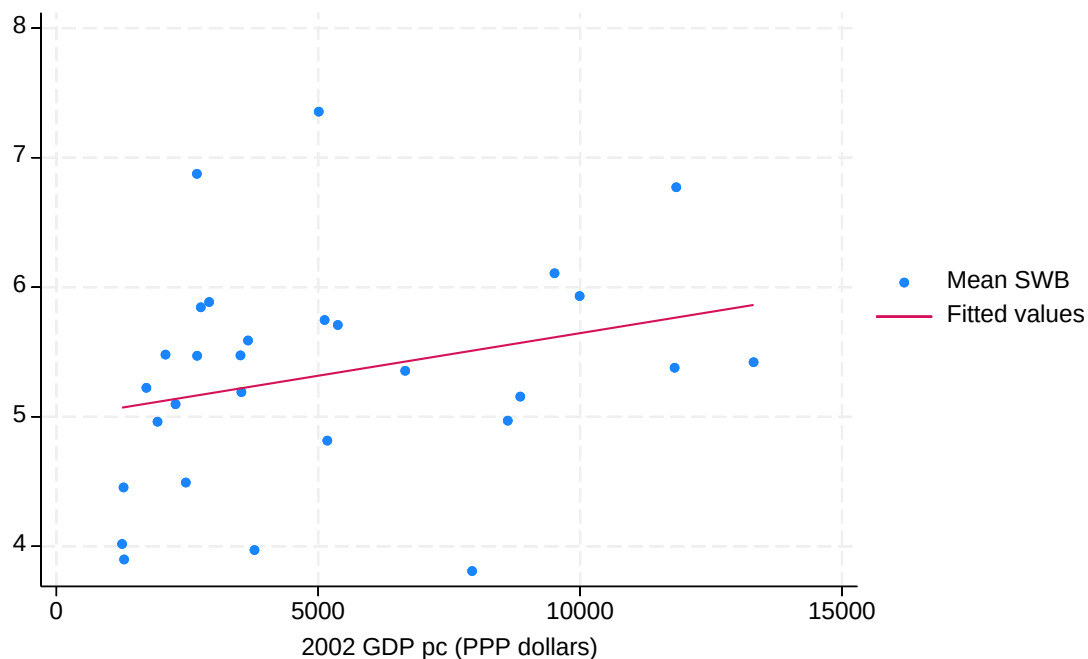

Histogram of Mean SWB

Histogram of Income per capita

Scatterplot of Mean SWB against Income per capita

For the 29 low-income countries in our sample, the positive slope of the line of best fit in the scatterplot suggests a positive association between average SWB and income per capita. However, the facts that (i) the line of best fit is not very steep and (ii) there is quite a bit of scatter of the data points around the fitted line suggest the apparent association is not highly statistically significant, and that the differences in mean SWB

associated with differences in income per capita are not large. We could investigate these issues further by doing some kind of test of statistical significance and by calculating the estimated elasticity of mean SWB with respect to income per capita.

Moreover, as evident in the histogram of *gdppc*, the distribution of *gdppc* for our sample is strongly skewed to the right. We might therefore get a better linear fit, and therefore obtain more a more precise estimate of the association between average SWB and income per capita, if we were to transform the values of income per capita to natural logs before generating the scatterplot.
